

Rhinovirus

The leading cause of the common cold

What Is It?

Rhinoviruses are the major cause of the common cold.¹ Having the common cold is the main reason children are absent from school and adults miss work.² On average, children suffer 6 to 8 colds per year while adults typically range from 4 to 6.³

Symptoms and Treatment

Common cold symptoms include runny nose, nasal congestion, sore throat, headache and cough. The symptoms usually begin 2 to 3 days after infection. With a rhinovirus infection, fever is usually slight but can climb to 102 degrees Fahrenheit in infants and young children. Symptoms can last from 2 to 14 days. Like many viral infections, the common cold is best treated with rest and fluids because there are no known cures.²

How Does Rhinovirus Spread?

Rhinovirus can live on your hands and is spread by touching the mouth, nose or eyes after contact with an infected individual or a contaminated surface.² Rhinoviruses can survive on surfaces for several hours.⁴ Airborne transmission from coughs and sneezes is also possible. Rhinoviruses are most active in early fall, spring and summer.

How Can I Help Prevent the Spread of Rhinovirus?

- ▶ Practice proper hand hygiene. Wash hands carefully and frequently with soap and water. Alcohol-based hand sanitizers containing at least 62% alcohol are also effective.
- ▶ Ensure frequent cleaning and disinfecting of commonly touched surfaces.
- ▶ Use EPA-registered disinfectants with a rhinovirus claim.
- ▶ Cough or sneeze into a tissue or your elbow. Avoid coughing or sneezing into your hands. Illness-causing germs can spread through touch.

Americans have an estimated 1 billion colds each year.¹
